GARDEN FOLLY-CLASSIC CHINESE TEMPLE

-THE FINAL PROJECT OF IMPLEMETATION II

JIUYU YANG 4/22/2022

PROJECT INTRODUCTION

The folly is the timber structure that provides four separate sitting spaces. The plaza consists of a pavilion, four trees, and concrete pavement. Heralding Spring Pavilion, the name of this structure original from Chinese culture, represents the great beginning of a new year and indicates that everything will move forward without obstruction. Four sitting timber chairs around the center round table are made of timber that supports shading areas for visitors, especially during summer. Four palm tree pits surround the folly, implying it is a tropical landscape, and the brick structure creates boundaries between soil and concrete that can protect tree roots from pollution.

My current studio project is in Charleston, SC. Sabal Palm is the native and state tree in South Carolina. This project is about creating a great campus, which means it needs to ensure people can feel comfortable and safe when they walk through the area. The shelter infrastructure is essential to propose on campus so that people can do active and passive activities despite outdoor conditions except for some extreme weather.
