Facilities for Adults with Autism Spectrum Disorders (ASD) have the potential to enhance the quality of life through the built environment and the comprehensive services they provide. This design project is the result of a series of strategies and guidelines that are informed by best practices and incorporate the needs and preferences of adults with ASD. The design aims to create a supportive environment that fosters health, wellness, independence, and integration.

The on-site comprehensive services, such as health, wellness, and behavioral support, reduce the need for external services. The built environment is designed to promote safety, accessibility, and community integration. The site plan and pathways are carefully planned to ensure that all areas are accessible and that the design supports the functional needs of adults with ASD.
