RT-420 Implementation of CII Best Practices for Small or Low Complexity Capital Projects

CONSTRUCTION INDUSTRY INSTITUTE

Research Objective

- Objective: Provide guidance to capital project organizations on implementing CII Best Practices for Small or Low Complexity Projects, subject to maintaining the fundamental best practices and underpinning principles but adjusting the scope of approach and scaling down their implementation methods.
- The definition of a "small project" can indeed vary significantly depending on various factors such as the industry sector, the size of the firm, and the specific context of the project. Each firm will use its own criteria to determine whether a project is considered small. If a firm does not have any guidance, RT-420 recommends the firm utilize the RT-305 complexity tools and/or attributes.

Achieving the Research Objective

To achieve this objective, we have created a toolkit to help downscale CII Best Practices for application in small or lowcomplexity projects. It includes targeted recommendations from the RT-420 research team that indicate which components of each best practice are most applicable, or may be customized, for smaller project environments. Importantly, the toolkit is highly customizable, allowing organizations to tailor its use based on their internal processes or adapt it on a project-by-project basis to meet specific needs. This flexibility ensures that companies can implement best practices in a way that is both efficient and effective, without compromising on essential project outcomes.

CII RT-420 Implementation Self-Assessment Tool

 The new Implementation Self-Assessment Tool is a document that provides a replicable methodology for adapting any of the 17 Best Practices to the specific needs of Small or Low Complexity Capital Projects. It features two distinct modes: "Large Project Mode" and "Small Project Mode", both represented by a purple and orange button, respectively. The Large Project Mode consists of the current Implementation self-assessment tool previously developed by RT-166, making it suitable for large or higher complexity projects. In contrast, the Small Project Mode introduces new content and customizations created by RT-420 to better address the unique requirements of smaller-scale projects. These customizations are further illustrated in the following pages.

We invite you to take a few moments to watch a tutorial of the Toolkit
