PREPARED MICROSCOPE SLIDES

Catalog No.: SL-HFF4
Human Foreskin Fibroblasts- four color
Unit Size: Each

SAMPLE DESCRIPTION: This prepared slide features adherent human foreskin fibroblast cells stained with 4 colors. The cells have been immunostained with antibodies that decorate alpha-tubulin (488), vimentin (555), and an outer mitochondrial membrane protein Tomm20 (635). The nuclei are counterstained with DAPI. Peak excitation/emission wavelengths of the featured fluorophores are 350/470 nm, 499/520 nm, 553/568 nm, and 633/648 nm. The sample works well for widefield or confocal microscopy. Standard filter sets for blue/green/orange-red/far red imaging will work well for this sample. The sample was prepared in a hard mount with a refractive index of 1.47.

STORAGE: We suggest storing the prepared slide in the slide holder at 4-10°C. Protect from prolonged exposure to light.

SLIDE USE: This slide is intended for use by technically qualified individuals with appropriate training to handle potentially hazardous materials. It is meant to be used for demonstration purposes and should not be transferred to a third party.
